

MCP IS NOT
THE ONLY PATH.
**A CODING AGENT
WITH A HARNESS
CAN REPLACE IT.**

Token cost, control, and the line between.

M E T A X I S

MCP IS ALWAYS
ON. THAT
COSTS TOKENS.
**THE AGENT
DECIDES WHEN IT
NEEDS A TOOL.**

MCP

Always connected. Tokens spent whether the tool is needed or not.

HARNESS

Agent calls the tool only when it needs it, with Human approval.

One decision saves repeated token overhead.

**THE HARNESS
STAYS IN
CONTROL.
IT SETS WHICH
TOOLS, WHEN, AND
HOW.**

HOW IT WORKS

Harness defines the rules

Agent picks the tool it needs

Calls it via terminal command

Human approves before it runs

The agent has no full autonomy. Every tool call waits for approval.

A REAL EXAMPLE
FROM PRACTICE.
**CLAUDE CODE
WORKED WITH
GITHUB THROUGH
COMMANDS, NO
MCP.**

MCP STILL MAKES
SENSE SOMETIMES.
**KNOW THE LINE
BETWEEN
HARNESS AND
MCP.**
